

Object oriented Programming Laboratory

Lab Cycle 1.2 : Date 19/08/2020

Due date: 26/08/2020

1. Write class which contains an integer array and a **static function** to find the average of that array. Create THREE objects. Read the values into the array using one object, and find the average. Let the second object modifies the value by multiplying each element by a certain multiplier. Repeat the process of finding the average usng first object.
2. Write a program to find shortest distance between three coordinates points, representing vertices of a triangle, using **inline** function.
3. Write a function called swap() that interchanges two **int** values belonging to an object, passed as parameter to it by the calling program. Write a C++ program to demonstrate **call by value, call by reference and call by address**.
4. Write a function called power() that takes a double value for **n** and an int value for **p**, and returns the result as a double value. Create a series of overloaded functions with the same name that, in addition to double, also work with types char, int, long, and float. Write a main() program that exercises these overloaded functions with all argument types.
